CYBER DEFENCE CAPABILITIES

KNOW FIRST. ACT FIRST.

CYBER DEFENCE

OVERVIEW - OSINT FOR CYBER DEFENCE

The very nature of Cyber Attacks means they are invariably run through connected computer networks, and the actors by necessity are online. With the pivotal nature of digital in our lives, and an *increasing* reliance on it for every facet of our existence, understanding these attacks is critical.

TREND ANALYSIS

Worldstack's products and services identify the tools, techniques, and procedures of threat actors, and calculate overall trends. Understanding the shape and overall direction of threats can help address them more succinctly.

Through our **Machine Learning platform**, **Providence**, we cultivate a feed of vulnerability and exploit profiles distilled from oceans of internet traffic and social media chatter.

THREAT VIGILANCE

By understanding new attack vectors and how they pertain to the technologies and products employed by your organisation, you can be proactive in your security measures and protect against emerging vulnerabilities.

Our solutions provide total vigilance and alert you to any attacks that may be still in the planning stage, allowing you to prepare and react accordingly. We monitor your online digital footprint to identify potential attack surfaces, and can even monitor employees to identify insider threats - malicious or otherwise - **like** leaked information.

INCIDENT RESPONSE & INSIDER THREATS

Once an attack has taken place, traditionally reliable attribution pointing directly to a threat actor has been incredibly difficult. Worldstack can dramatically increase the odds of accurate attribution and provide intelligence for decision-making. Our solutions can even find information on malware located inside your organisation, and thereby allow for a more rapid and proactive response.
